Introduction to Containers, Kubernetes, and OpenShift

Module 1 Cheat Sheet: Understanding the Benefits of Containers

The Docker CLI

Command	Description
docker build	Builds an image from a Dockerfile.
docker CLI	Start the Docker command line interface.
docker container rm	Removes a container.
docker images	Lists the images.
docker ps	Lists the containers.
docker pull	Pulls the latest image or repository from a registry.
docker push	Pushes an image or a repository to a registry.
docker run	Runs the <image name> in a new container.
docker run	Runs a command in a new container.
docker stop	Stops one or more running containers.
docker tag	Creates a tag for a target image that refers to a source image.
